

Alternative Pulley Open/Close System for Wide Canopies

If you would prefer wider width panels on your canopy, that is possible. If your canopy is wider than 60 inches and you want to install the “Pulley Open/Close System” we recommend that you attach two or more separate lines to the retractable end of the canopy. Strap eyes used for securing lines should be attached evenly spaced along the width of the canopy’s retractable end. It is recommended that lines be spaced no more than 36 inches apart. If your canopy panel requires two or more separate lines to operate a single canopy, it is best to keep each pulley system confined to a single panel. Otherwise, the effort required to retract and extend becomes extreme.

At this time the Sailrite Fabric Calculator does not figure the correct amount of hardware for canopies that are 60 inches or wider. Please contact info@sailrite.com for a custom quote.
